

Built with safety in mind.

Our software uses Docker containers to isolate our internal servers from your network. If you have a container cloud already, we can integrate our software there as well.

- Pulls from Docker registry
- Signed code to prevent unwanted changes
- Data via MSSQL standard connection
- Isolated codebase/hardware

Virtualization Requirements:

All traffic is routed through our internal Nginx web server and through our authenticated API, so there's no chance of data being accessed without permission.

- Docker Engine 19 or higher
- Docker Compose 1.24 or higher
- Teamviewer (for remote access)
- MSSQL database access, IP via port 1433
- Ports 80/443 inbound/outbound access
- Port 80 inbound/outbound access
